APPLE PRODUCTION BY VARIETIES 1943 AND 1944

The leading apple variety from the standpoint of commercial production continues to be the Delicious with the Winesap in second place and McIntosh third according to a report on apple production by varieties by the Crop Reporting Board of the Bureau of Agricultural Economics. Of the total commercial production in the United States of 124,212,000 bushels for 1944 it is estimated that 22,182,000 bushels were Delicious, 15,066,000 bushels were Winesaps and 11,592,000 bushels were McIntosh. Total apple production in commercial areas was estimated at 89,050,000 bushels for 1943 and 128,273,000 bushels in 1942 with the same three varieties at the top in each year and in the same order except that production of McIntosh was greater than that of Winesaps in 1942.

The designation of certain apple varieties as summer, fall, or winter sometimes varies in different sections of the country. In this report, however, each variety is classified according to the season that is most representative of the variety for the country as a whole.

SUMMER VARIETIES: Production of apples from varieties harvested in the summer is estimated at 5,958,000 bushels in 1944 or about 5 percent of the total commercial crop compared with 5,575,000 bushels in 1943 or 6 percent of the 1943 crop and 5,455,000 bushels or 4 percent for 1942. Of the summer variety total, 1,701,000 bushels were California Gravensteins in 1944, 2,262,000 bushels in 1943 and 1,315,000 bushels in 1942.

FALL VARIETIES: Production of apples in 1944 from varieties harvested in the late summer and early fall is indicated to have been about 13 percent of the total commercial crop or 16,813,000 bushels. In 1943 these varieties accounted for 14 percent of the total with 12,395,000 bushels and in 1942 also 14 percent with 17,965,000 bushels. Jonathan continues to be the outstanding fall variety with production in 1944 indicated at 9,357,000 bushels. This is 54 percent above the 1943 production of 6,063,000 bushels but slightly below the 1942 crop of 9,583,000 bushels. Grimes Golden production at 2,583,000 bushels in 1944 is also well above the 1943 estimate of 1,550,000 bushels but 6 percent below the 1942 production of 2,757,000 bushels. Wealthys this year produced the smallest crop of the 3-year period -- 2,005,000 bushels in 1944 compared with 2,427,000 bushels in 1943 and 2,137,000 bushels in 1942.

WINTER VARIETIES: The total 1944 winter crop of commercial apples is estimated at 101,441,000 bushels or 82 percent of total U. S. commercial apple production. Last year these varieties totaled 71,080,000 bushels and in 1942 production was 104,853,000 bushels.

BALDWINS: A light crop of 3,964,000 bushels was produced in 1943, which was, however, 32 percent more than the very short crop last year but 43 percent less than the large crop of 1942. New York is the most important State in the production of Baldwins and in 1944 produced 47 percent of the Nation's total. The North Atlantic States produced 82 percent of the total for this variety.

DELICIOUS: U. S. commercial production for this season totals 22,182,000 bushels compared with 14,846,000 in 1943 and 21,651,000 in 1942. The Delicious is the Nation's most important apple variety and this year comprised 18 percent of total commercial production. Washington is the most important State for the production of Delicious as well as for all varieties of apples combined. In 1944 the Delicious crop in Washington amounted to 13,030,000 bushels or about 59 percent of

the total commercial crop of this variety. About 44 percent in Washington were the newer red varieties which have been rapidly increasing in importance. The Delicious crop in Virginia, which usually ranks second in production of this variety, is placed at 1,603,000 bushels — almost 10 times as much as last year's short crop and about 3 percent more than the large 1942 crop.

McINTOSH: This is the third most important variety in the U. S. and the most important variety in the North Atlantic States. Production in 1944 was 11,592,000 bushels compared with 9,129,000 last year and 13,371,000 in 1942.

ROME BEAUTY: Production is indicated at 6,852,000 bushels in 1944 which is nearly 39 percent larger than the 1943 estimate of 4,936,000 bushels but is slightly less than the 1942 production of 7,098,000 bushels.

STAYMAN: The commercial crop was 8,630,000 bushels — 2 1/4 times as large as the short crop of last year and 1 percent larger than in 1942.

WINESEAPS: The indicated 1944 crop of 15,066,000 bushels is by far the largest of the 3-year series, compared with 10,476,000 bushels in 1943 and 11,992,000 bushels in 1942.

YORK IMPERIAL: Production turned out shorter than indicated during the growing season and is now estimated at 6,700,000 bushels compared with 4,396,000 bushels last year and 8,725,000 bushels in 1942. Pennsylvania, Virginia, and West Virginia produced 92 percent of this variety in 1944.

December 1944

The preceding tables show commercial production of apples for each principal variety by States and regions. This arrangement of data was made to facilitate comparisons between varieties.

In the following tables, however, the same data are presented for the principal producing States, by varieties of apples. The arrangement is shown in this form to facilitate comparisons between States and regions for the varieties listed.
